Question: 2003-11-21 - Dr. Douglas Jones, Good Day! Thank you for my member

Dr. Douglas Jones, Good Day!  
Thank you for my membership extension to Nov 21/03.  
I relapsed on Oct 23/03 while she was at home. Now she is hospitalized heading for another bone marrow transplant, very probably from a non related donor this time.  
My question today is a curiosity question.  
Before relapsing, while she was at home, played with electronics toys, like guns and automatic weapons.  
My question is how much electronics can activate silent or dormant cancer cells like the ones of Danielle?  
Regards,

Anemia occurs when there is a lower than normal level of red blood cells. Anemia can be caused by such events as blood loss, as in surgery; or certain diseases, such as cancer, kidney disease or HIV; or by treatment such as chemotherapy or AZT. It can also be due to deficiencies in iron, folate, and/or vitamin B12.

Anemia can be a grave health condition which can cause a person to feel weak, tired and can lead to serious heart problems and other serious complications. When the number of red blood cells falls below normal the body gets less oxygen and therefore has less energy than it needs to function properly. Anemia may become worse if it is not treated, and it can lead to potentially serious, even life-threatening complications. As anemia causes the number of red blood cells to decrease, the heart works harder, pumping more blood to send more oxygen throughout the body. If the heart works too hard, it can develop disorders. The symptoms of anemia can become so severe that some people may become bedridden. They can't work or even perform basic daily activities, like grocery shopping or taking the dog for a walk. At the other extreme, some people have anemia but do not have any symptoms.

There is positive news about anemia because it can be treated so that
